## Research Interests

I am in particular interested in the theory of solutions in terms of statistical mechanical descriptions like the Kirkwood-Buff theory. I aim to further develop and to apply these theories for a molecular description of soft matter properties in solution. Therefore, my research mainly focuses on structural and dynamic effects of solvents and co-solutes and their influence on macromolecules. Typical systems of interest include polyelectrolytes, DNA and proteins in conjunction with ions, ionic liquids and low weight organic co-solutes in different solvents and under external influences. Over the last years, I mainly studied the molecular mechanisms behind polyelectrolyte and counterion properties, solvent effects, transport and solvation in electrolyte and ionic liquid solution and the influence of aqueous ionic liquids and co-solutes on macromolecular conformations. Moreover, I am also interested in electrokinetic phenomena, which are mostly represented by electroosmosis and electrophoresis in presence of slippage effects. Due to these reasons, I worked on the coupling between electrostatic, hydrodynamic and friction effects and the corresponding implications for transport properties and macromolecular separation techniques. Finally, I developed and applied free energy and rare event methods to study transition pathways and the influence of enthalpic and entropic contributions on free energy minima. The theoretical understanding of hidden complexities and the corresponding implications like hysteresis effects in low-dimensional free energy landscapes further attracted my interest.
